XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX

Introduction

This Draft Sri Lanka Standard has been prepared by the Sri Lanka Standards Institution and is now being circulated for technical comments to all interested parties.

All comments received will be considered by the SLSI and the draft if necessary, before submission to the Council of the Institution through the relevant Divisional Committee for final approval.

The Institution would appreciate any views on this draft which should be sent before the specified date. It would also be helpful if those who find the draft generally acceptable could kindly notify us accordingly.

All Communications should be addressed to:

The Director General
Sri Lanka Standards Institution,
17, Victoria Place,
Elvitigala Mawatha,
Colombo 08.

**Draft Sri Lanka Standard
SPECIFICATION FOR PASSENGER
CAR TYRES
(First Revision)**

SRI LANKA**

Draft Sri Lanka Standard
SPECIFICATION FOR PASSENGER CAR TYRES
(First Revision)

FOREWORD

This standard was approved by the Sectoral Committee on Materials, Mechanical Systems and Manufacturing Engineering and was authorized for adoption and publication as a Sri Lanka Standard by the Council of the Sri Lanka Standards Institution on 20xx-xx-xx.

For the purpose of deciding whether a particular requirement of this specification is complied with the final value observed or calculated, expressing a result of a test or an analysis shall be rounded off in accordance with SLS 102. The number of significant places retained in the rounded off value shall be the same as that of the specified value in this specification.

Guidelines are given for the determination of a compliance of a lot with the requirements of this standard based on statistical sampling and inspection in Appendix E.

This revision of SLS 1212 cancels and replaces the first edition of the standard, SLS 1212: 2001.

In the preparation of this specification the assistance derived from the following publications is gratefully acknowledged:

ISO 4000: 2021 - Passenger car tyres and rims Part 1: Tyres (metric series)

ISO 10191: 2021 - Passenger car tyres — Verifying tyre capabilities — Laboratory test methods

IS 15633: 2005 - Automotive Vehicles — Pneumatic Tyres for Passenger Car Vehicles — Diagonal and Radial Ply — Specification

1 SCOPE

This standard specifies the designation, dimensions, markings, performance requirements, testing and load ratings of metric-series tyres primarily intended for passenger cars.

2 NORMATIVE REFERENCES

The following standards, in whole or in part, are normatively referenced in this document and are indispensable for its application. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

SLS 102: Presentation of numerical values

SLS 428: Random sampling method

SLS ISO 3877-1 Tyres, valves, and tubes — List of equivalent terms — Part 1: Tyres

SLS ISO 4223-1 Definitions of some terms used in the tyre industry — Part 1: Pneumatic tyres

ISO 16992 Passenger car tyres — Spare unit substitutive equipment (SUSE)

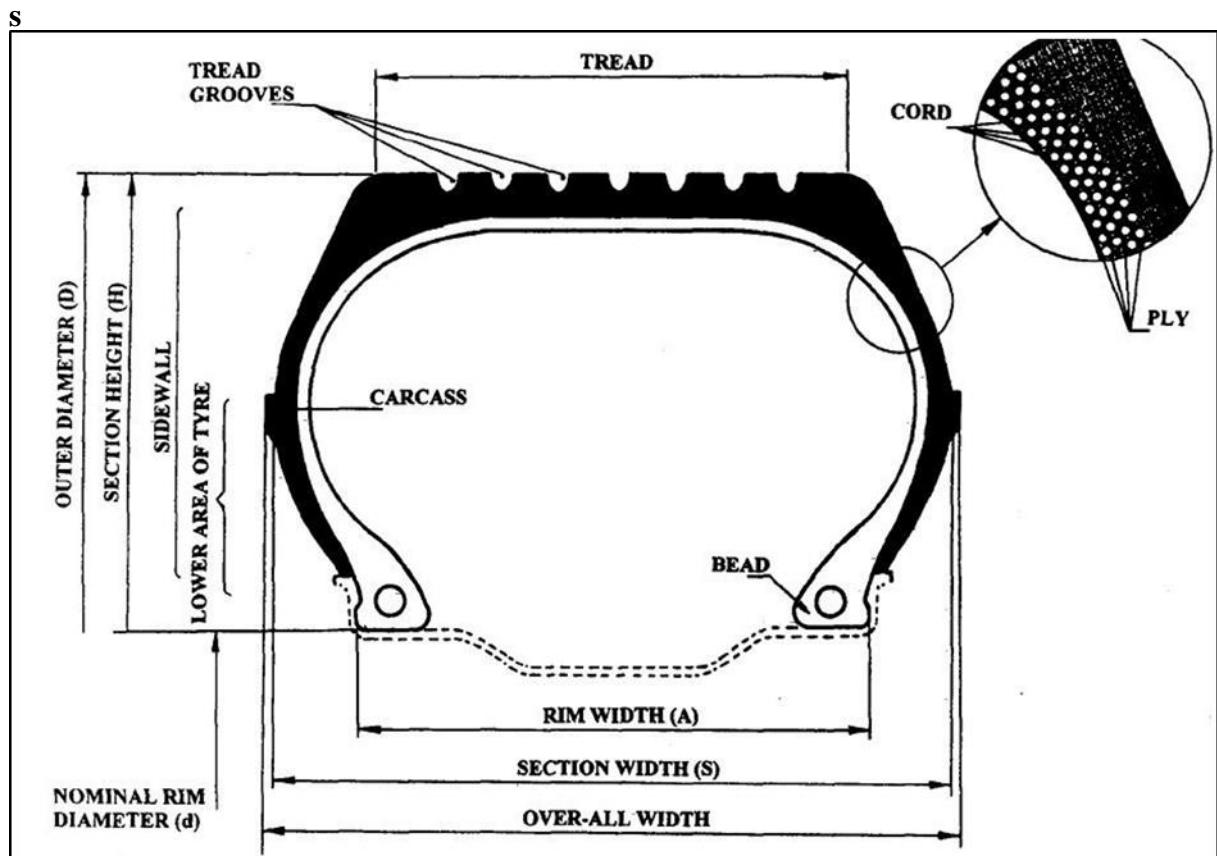

ISO 10191: Passenger car tyres - verifying tyre capabilities - laboratory test methods

3 TERMS AND DEFINITIONS

For the purposes of this document, the terms and definitions given in ISO 3877-1, ISO 4223-1 and the following apply.

3.1 Tyre — An annular toroidal shaped inflatable envelope made of elastic -materials, natural and/or synthetic rubber or a blend thereof, reinforced with a textile/steel cord fabric casing enclosing multi-coil wire headings. The tyre is so made that it can be used by mounting and inflating on the appropriate rim.

3.2 Nomenclature:

3.3 rim protector: feature incorporated into the lower sidewall area of the tyre which is intended to protect the rim flange from damage.

EXAMPLE Protruding circumferential rubber rib.

3.4 Structure — Tyre technical characteristics of the tyre's carcass. The following structures are distinguished in particular.

3.4.1 Diagonal or Bias-Ply — Structure in which the ply cords extend to the beads and are laid at alternate angles of substantially less than 90° to the centre line of the tread.

3.4.2 Bias-Belted — Structure of diagonal (bias-ply) type in which the carcass is restricted by a belt comprising two or more layers of substantially inextensible cord material laid at alternate angles close to those of the carcass.

3.4.3 Radial — Structure in which the ply cords extend to the beads and are laid substantially at 90° to the centre line of the tread. the carcass being stabilized by an essentially inextensible circumferential belt.

3.4.4 Reinforced or Extra Load — Tyre structure in which the carcass is more resistant than that of the corresponding standard tyre.

4 DESIGNATION

4.1 Size and construction

4.1.1 Characteristics

The tyre characteristics shall be designated:

Nominal section width / Nominal aspect ratio Tyre construction code Nominal rim diameter code

EXAMPLE:

235/45 R 17.

4.1.2 Nominal section width

The nominal section width of the tyre shall be indicated in millimetres. and this part of the designation shall end in either the numeral of zero or five. so that in any single series of tyres with the same nominal aspect ratio. the values shall all end in 0 or all end in 5.

For sizes mounted on 5° tapered (code-designated) rims. the nominal section width shall end in 5.

4.1.3 Nominal aspect ratio

The nominal aspect ratio (H/S . where H is the design tyre section height and S is the design tyre section width) shall be expressed as a percentage and shall be a multiple of 5.

4.1.4 Tyre construction code

The tyre construction code shall be:

- B for bias-belted construction;
- D for diagonal construction;
- R for radial construction;
- RF for radial run-flat construction (only applicable to run-flat or self-supporting tyres as defined in ISO 16992; radial extended mobility tyres as defined in ISO 16992 shall have the construction code R).

In the case of tyres having a maximum speed capability exceeding 240 km/h. the tyre construction code R can be replaced by ZR and the tyre construction code RF can be replaced by ZRF.
 In the case of tyres having a maximum speed capability exceeding 300 km/h. the tyre construction code R shall be replaced by ZR and the tyre construction code RF shall be replaced by ZRF.
 Use of any other code-letter (e.g. in the case of a new construction type) should first be submitted to SLSI for acceptance.

4.1.5 Nominal rim diameter code

For tyres mounted on 5° tapered (code-designated) rims. the code shall be as given in Table 1.

Table 1 — Nominal rim diameter code

| Nominal rim diameter code | Nominal rim diameter. D_r mm |
|----------------------------------|--|
| 10 | 254 |
| 12 | 305 |
| 13 | 330 |
| 14 | 356 |
| 15 | 381 |
| 16 | 406 |
| 17 | 432 |
| 18 | 457 |
| 19 | 483 |
| 20 | 508 |
| 21 | 533 |
| 22 | 559 |
| 23 | 584 |
| 24 | 610 |
| 25 | 635 |
| 26 | 660 |
| 28 | 711 |
| 30 | 762 |

In the case of tyres requiring new-concept rims. for safety reasons. especially concerning mounting. the code-number shall be equal to the nominal rim diameter (D_r) expressed as a whole number in millimetres.

4.2 Service description

4.2.1 General

The service description shall be:

Load index Speed symbol

In the case of tyres having a maximum speed capability exceeding 300 km/h. the speed symbol Y and the load index shall both be placed within parentheses. to identify performance up to 300 km/h.

EXAMPLE 235/45 ZR 17 (97Y).

For maximum speed capability and load carrying capacity of the tyre over 300 km/h. the manufacturer shall indicate on the packaging. specifications sheet or tyre.

4.2.2 Load index

The maximum tyre load-carrying capacity corresponding to the service conditions specified by the tyre manufacturer shall be indicated by a load index taken from Table 2. per tyre for a single mounting.

4.2.3 Speed symbol

Alpha or alpha-numeric code which indicates the speed category (**4.2.4**) of the tyre.

4.2.4 Speed category

A speed category is assigned to a tyre according to the maximum speed which the tyre can sustain. It is expressed by the speed symbol. in accordance with Table 3.

4.3 Other service characteristics

4.3.1 The word “TUBELESS” shall appear on the sidewalls of tyres without tubes.

4.3.2 The letters “XL”. close to the tyre size designation. or the words “REINFORCED” or “EXTRA LOAD” shall appear on the sidewalls of tyres designed for loads and inflation pressures higher than the standard version (tyres of the same size).

4.3.3 The letters “LL”. close to the tyre size designation. or the words “LIGHT LOAD” shall appear on the sidewalls of tyres designed for loads lower than the standard version (tyres of the same size).

4.3.4 The letter “T”. immediately preceding the tyre size designation. shall be used to identify T-type temporary-use spare tyres.

4.3.5 Specific indications. if required. can be added to indicate:

- the type of vehicle for which the tyre is primarily designed. using the symbol “P” for passenger cars (see 4.3.6);
- temporary use of certain spare tyres. using indications such as “TEMPORARY USE ONLY”;
- bias-belted construction. with the words “BIAS-BELTED”;
- radial construction. with the word “RADIAL”;
- direction of mounting;
- direction of rotation;
- type of tread pattern;
- other characteristics.

4.3.6 The optional marking “P” can be used where there could be ambiguity regarding the tyre type. It should be positioned such that confusion cannot result from its proximity to any other service condition marking.

EXAMPLE P295/45 R 17.

Table 2 — Equivalence between load index (LI) and tyre load-carrying capacity (TLCC)

| LI | TLCC kg | LI | TLCC kg | LI | TLCC kg | LI | TLCC kg |
|----|------------|----|------------|-----|------------|------------------|------------|
| 50 | 190 | 70 | 335 | 90 | 600 | 110 | 1 060 |
| 51 | 195 | 71 | 345 | 91 | 615 | 111 | 1 090 |
| 52 | 200 | 72 | 355 | 92 | 630 | 112 | 1 120 |
| 53 | 206 | 73 | 365 | 93 | 650 | 113 | 1 150 |
| 54 | 212 | 74 | 375 | 94 | 670 | 114 | 1 180 |

| 64 | 280 | 84 | 500 | 104 | 900 | — | — |
| 65 | 290 | 85 | 515 | 105 | 925 | — | — |
| 66 | 300 | 86 | 530 | 106 | 950 | — | — |
| 67 | 307 | 87 | 545 | 107 | 975 | — | — |
| 68 | 315 | 88 | 560 | 108 | 1 000 | — | — |
| 69 | 325 | 89 | 580 | 109 | 1 030 | — | — |

^a ISO tyre loads according to this document have a 116 load index maximum: some existing tyres can have a higher load index number.

The maximum tyre load carrying capacity corresponding to the load index shall apply for speeds up to and including 210 km/h.

For tyres with the speed symbol V (between 210 km/h and 240 km/h). the maximum load carrying capacity per tyre shall be reduced to 100 % at 210 km/h. 97 % at 220 km/h. 94 % at 230 km/h and 91 % at 240 km/h; linear interpolation is permitted.

In the case of speed symbols W and Y. the maximum load carrying capacity per tyre corresponding to the load index shall apply for speeds up to and including 240 km/h for W and 270 km/h for Y.

For tyres with the speed symbol W (between 240 km/h and 270 km/h). the maximum load carrying capacity per tyre shall be reduced to 100 % at 240 km/h. 95 % at 250 km/h. 90 % at 260 km/h and 85 % at 270 km/h; linear interpolation is permitted.

For tyres with the speed symbol Y (between 270 km/h and 300 km/h). the maximum load carrying capacity per tyre shall be reduced to 100 % at 270 km/h. 95 % at 280 km/h. 90 % at 290 km/h and 85 % at 300 km/h; linear interpolation is permitted.

See 4.2.3. 4.2.4 and Table 3 for speed categories and their symbols.

For speeds of over 300 km/h or ZR-marked tyres or both. refer the packaging/specification sheet or consult the tyre manufacturer for the maximum tyre load carrying capacity permitted in relation to the maximum speed allowed for the tyre.

For vehicles with a design maximum speed capability of up to 60 km/h. the maximum load carrying capacity corresponding to the load index can be exceeded. as shown below. However. an increase in the reference inflation pressure is necessary and should be determined in consultation with the tyre manufacturer. In the absence of such agreement. the following pressure increases are recommended:

- for 60 km/h. a 10 % load increase with a 10 kPa inflation pressure increase;
- for 50 km/h. a 15 % load increase with a 20 kPa inflation pressure increase;
- for 40 km/h. a 25 % load increase with a 30 kPa inflation pressure increase;
- for 30 km/h. a 35 % load increase with a 40 kPa inflation pressure increase;
- for 25 km/h. a 42 % load increase with a 50 kPa inflation pressure increase.

Table 3 — Speed symbols and corresponding speed

| Speed symbol | Speed km/h |
|----------------|---------------|
| J | 100 |
| K | 110 |
| L | 120 |
| M | 130 |
| N | 140 |
| P | 150 |
| Q | 160 |
| R | 170 |
| S | 180 |
| T | 190 |
| U | 200 |
| H | 210 |
| V | 240 |
| W | 270 |
| Y ^a | 300 |

NOTE This list is not exhaustive, and other categories and symbols can be added later.

a For tyres designed for speeds exceeding 300 km/h, see 4.2.1.

5 TYRE DIMENSIONS

5.1 Rounding values

Except in the cases given in 5.2.1 and 5.2.2, round the formula-derived values for tyre dimensions to the nearest millimetre (see ISO 80000-1:2009, B.3, rule B).

5.2 Calculation of design tyre dimensions

5.2.1 Theoretical rim width, R_{th}

See Formula (1):

$$R_{th} = K_I \times S_N \quad (1)$$

where,

R_{th} is the theoretical rim width, expressed in millimetres;

K_I is the theoretical rim/section width ratio coefficient;

S_N is the nominal section width.

For tyres mounted on 5° rims (code-designated) with nominal rim diameter expressed by a two-figure code:

- $K_I = 0.7$ where the tyres have a nominal aspect ratio of 50 to 95;
- $K_I = 0.85$ where this ratio is 20 to 45.

NOTE: K_I values for other tyre and rim types will be defined in a future revision.

5.2.2 Measuring rim width code. R_{mc}

See Formula (2). where R_{mc} is rounded to the nearest 0.5 rim width code:

$$R_{mc} = \frac{K_2 \times S_N}{25.4}$$

where K_2 is the measuring rim/section width ratio coefficient.

For tyres mounted on 5° drop-centre rims with a nominal diameter expressed by a two-figure code:

- $K_2 = 0.7$ for nominal aspect ratios 95 to 75;
- $K_2 = 0.75$ for nominal aspect ratios 70 to 60;
- $K_2 = 0.8$ for nominal aspect ratios 55 and 50;
- $K_2 = 0.85$ for nominal aspect ratio 45;
- $K_2 = 0.9$ for nominal aspect ratios 40 to 30;
- $K_2 = 0.92$ for nominal aspect ratios 20 and 25.

NOTE: Other values of K_2 for other tyre and rim types will be defined in a future revision.

5.2.3 Design tyre section width. S

The design tyre section width. S . is the nominal section width. S_N . transferred from the theoretical rim. R_{th} . to the measuring rim width code. R_{mc} . as shown in Formula (3):

$$S = S_N + 0.4 \times (25.4 \times R_{mc} - R_{th}) \quad (3)$$

EXAMPLE 265/40 R17.

$K_1 = 0.85$ (see 5.2.1) and $K_2 = 0.9$ (see 5.2.2).

$$R_{th} = K_1 \times S_N = 265 \times 0.85 = 225.25 \text{ mm.}$$

$$R_{mc} = K_2 \times S_N / 25.4 = 0.9 \times 265 / 25.4 = 9.39. \text{ rounded to } 9.5.$$

$$25.4 \times R_{mc} = 25.4 \times 9.5 = 241.3 \text{ mm.}$$

$$S = S_N + 0.4 (25.4 R_{mc} - R_{th}) = 265 + 0.4 (241.3 - 225.25) = 271.42. \text{ rounded to } 271 \text{ mm.}$$

5.2.4 Design tyre section height. H

The design tyre section height. H . is calculated using Formula (4):

$$H = S_N \times \frac{H/S}{100} \quad (4)$$

where H/S is the nominal aspect ratio.

5.2.5 Design tyre overall diameter. D_0

The design tyre overall diameter. D_0 . is calculated using Formula (5):

$$D_0 = D_r + 2 \times H \quad (5)$$

Use the corresponding value of D_r given in Table 1.

5.2.6 Guidelines

See Appendix A for general guidelines on the tyre design dimensions for the metric series of passenger car tyres mounted on 5° rims (code-designated).

5.3 Calculation of maximum overall (grown) tyre dimensions in service tyre mounted on their measuring rims

5.3.1 General

The calculation of maximum overall (grown) tyre dimensions in service for tyres mounted on their measuring rims is for use by vehicle manufacturers in designing for tyre clearance.

Calculate these dimensions with the coefficient appropriate to the design tyre section width and design tyre section height (see Table 4).

Table 4 — Coefficients for calculation of tyre dimensions

| Construction | Construction code | Coefficient | | | |
|---------------------|--------------------------|--------------------|----------|----------|----------|
| | | <i>a</i> | <i>b</i> | <i>c</i> | <i>d</i> |
| Diagonal | D | 1.1 | 1.08 | — | — |
| Bias-belted | B | | | — | — |
| Radial | R | 1.04 | 1'04 | 0.96 | 0.97 |
| Radial run-flat | RF | | | | |

5.3.2 Maximum overall (grown) width in service. W_{\max}

The maximum overall (grown) width in service. W_{\max} . includes elevation due to labelling, decorations, protective ribs or bands and rim protectors and is equal to the greater of the following values:

— the product of the design tyre section width. S . and the appropriate coefficient. a (see Table 4). see Formula (6):

$$W_{\max} = S \times a \quad (6)$$

— the addition of 8 mm to the design tyre section width. S . see Formula (7):

$$W_{\max} = S + 8 \quad (7)$$

If the overall (grown) width is measured at the rim protectors. an additional 8 mm is allowed. In this case. W_{\max} equals to the greater of the following values ($S \times a + 8$) or ($S + 16$).

5.3.3 Maximum overall (grown) diameter in service. $D_{0,\max}$

See Formula (8):

$$D_{0,\max} = D_r + 2 \times H \times b \quad (8)$$

See Table 4 for the value of coefficient b . $H \times b$ shall be first rounded to the nearest integer before calculating the maximum overall diameter in service.

5.4 Calculation of minimum tyre dimensions for radial tyres mounted on their measuring rims

5.4.1 Minimum tyre section width. S_{\min}

See Formula (9):

$$S_{\min} = S \times c \quad (9)$$

See Table 4 for the value of coefficient c .

5.4.2 Minimum tyre overall diameter. $D_{0,\min}$

See Formula (10):

$$D_{0,\min} = D_r + 2 \times H \times d \quad (10)$$

See Table 4 for the value of coefficient d . $H \times d$ shall be first rounded to the nearest integer before calculating the minimum overall diameter.

5.5 Range of approved rims

The range of approved rim width codes for the nominal aspect ratio of 35 and above is calculated as the product of the nominal section width. S_N . and the coefficients shown in Table 5. divided by 25.4. Round the values obtained to the nearest 0.5 rim width code. For tyre sizes with a nominal aspect ratio of 30 and below. the range of approved rim width codes is the measuring rim width code ± 0.5 .

The maximum overall (grown) width in service. W_{\max} . and the minimum tyre section width. S_{\min} . will change by 40 % of the change in rim width code multiplied by 25.4. rounded to the nearest millimetre. However. this is not applicable to tyres of which overall width is measured at the rim protectors. in which case. the change will be greater than 40 %.

Table 5 — Approved rim width codes for passenger car tyres as a function of nominal aspect ratio

| Nominal aspect ratio H/S | Coefficients for calculation of approved rim width | |
|-------------------------------|--|-------------------------------|
| | min. | max. |
| $70 \leq H / S \leq 95$ | 0.65 | 0.85 |
| $50 \leq H / S \leq 65$ | 0.7 | 0.9 |
| $H / S = 45$ | 0.8 | 0.95 |
| $35 \leq H / S \leq 40$ | 0.85 | 1 |
| $H / S \leq 30$ | measuring rim width code -0.5 | measuring rim width code +0.5 |

5.6 Tyre dimension measurement procedure

The tyre dimension measurement procedure shall be as described below:

- a) prior to measurement. mount the tyre on an approved rim. inflated to the recommended pressure given in Table 6. and allow it to stand for a minimum of 24 h at normal room temperature;
- b) readjust the inflation pressure to the original value;
- c) calliper the section width and the overall width of the tyre at six points approximately equally spaced around the tyre circumference. Record the average of these measurements as section width and overall width;
- d) determine the tyre overall diameter by measuring its maximum circumference and dividing this by π (where $\pi = 3.141\ 6$).

6 PERFORMANCE REQUIREMENTS

6.1 Endurance test

Endurance test of the tyre shall be conducted in accordance with ISO 10191 and at the completion of the test. the tyre shall be inspected and shall be free from load. cord. ply or tread separation or tread chunking or broken cords.

6.2 Strength test (plunger test)

The tyre shall conform to the breaking energy requirements. when tested in accordance with ISO 10191.

6.3 High-speed test

High speed test of the tyre shall be conducted in accordance with ISO 10191 and at the completion of the test. the tyre shall be inspected and shall be free from bead. cord. ply or tread separation or tread chunking or broken cords.

6.4 Bead unseating test (of tubeless tyres)

Bead unseating test of the tyre shall be conducted in accordance with ISO 10191 and at the completion of the test. the applied force required to unseat the tyre bead at the point of contact shall not be less than that shown in Table 7 or Table 8. as appropriate.

6.5 Tread-Wear -Indicators

6.5.1 The pneumatic tyre shall include not less than six transverse rows of wear indicators. approximately equally spaced and situated in the principal grooves of the tread. The tread-wear indicators shall be such that these cannot be confused with the rubber ridges between the ribs or blocks of the tread. However. in the case of tyres dimensions appropriate for mounting on rims of a nominal diameter code < 12 or less. minimum four numbers tread-wear indicators shall be accepted.

6.5.2 The tread-wear indicators must provide a means of indicating with a tolerance of $^{+0.60}_{-0.00}$ mm. when the tread grooves are no longer more than 1.6 mm deep.

6.5.3 The height of tread-wear indicators is determined by measuring the difference between the depth. from the tread's surface. to the top of the tread-wear indicator and to the bottom of the tread groove close to the slope at the base of the tread-wear indicator.

6.5.4 The tyre shall be considered unsafe for service on road when remain worn skid depth reaches minimum value of 1.6 mm at any part of the tread circumference.

7 INFLATION PRESSURES

Correct inflation pressures are of the highest importance for driving safety. Over-inflation causes the tyre to be more susceptible to impact damage.

Under-inflation causes over-heating and can greatly shorten the life of a tyre. It affects vehicle stability and can cause irregular wear. internal damage and. ultimately. even tyre disablement.

The effects of under-inflation are not necessarily immediate. It may be a considerable time before they occur. The pressures (cold) recommended by the tyre manufacturers in their technical documents should be regarded as a minima.

The recommended cold tyre inflation pressure for each tyre position specified by the vehicle and/or thetyre manufacturer for the intended service condition of the given vehicle shall be equal or higher than the minimum cold tyre inflation pressure. given by the tyre manufacturer or the tyre standardization body for the given service conditions.

The recommended cold tyre inflation pressure should take into account not only the tyre load-carrying capacity (see Appendix C) and the high-speed capability. but also the operating conditions such as maximum speed capability of the vehicle. camber angle. as well as the construction and characteristics of the vehicle.

Unless otherwise specified by the tyre manufacturer. it is recommended that the cold inflation pressure of radial tyres be limited in normal application to 350 kPa for all standard load. Extra load or light load version sizes on code designated rims, irrespective of the speed symbol (see Table 3).

For normal road applications. the specified inflation pressure cannot be less than:

- 140 kPa for vehicle operating speeds ≤ 160 km/h. and
- 180 kPa for vehicle operating speeds > 160 km/h. For special applications. consult the tyre manufacturer.

NOTE: Cold inflation pressure is the pressure of the tyre at ambient temperature and does not include pressure build-up due to tyre usage.

8 LOAD CARRYING-CAPACITIES

Use the load indices for passenger car tyres given in Appendix **B**.

For sizes not included in Appendix **B**. consult the National Standardization Organization.

The tyre load-carrying capacity at various inflation pressures given in Appendix **C** shall be used.

9 CHOICE OF TYRE SIZES

In selecting tyres for a vehicle. the vehicle maximum load on the tyre shall not be greater than the applicable maximum load-carrying capacity of the tyre. Vehicle maximum load on the tyre is the load on an individual tyre that is determined by distributing to each axle its share of the maximum loaded vehicle mass and dividing by the number of tyres on the axle.

The vehicle normal load on the tyre shall not be greater than 88 % of the maximum load-carrying capacity of the tyre. Vehicle normal load on the tyre is the load on an individual tyre that is determined by distributing (in accordance with Table 7) to each axle its share of the curb mass. accessory mass and normal occupant mass and dividing by the number of tyres on the axle. These. and other relevant masses. are defined below.

In specific local regulations. the vehicle normal load on the tyre shall not be greater than 94 % of the load rating at the vehicle manufacturer's recommended cold inflation pressure for the tyre.

The vehicle manufacturer can specify an inflation pressure less than that corresponding to the maximum tyre load. In this case. the load on the tyre (at the corresponding vehicle loading condition) shall not exceed the tyre load carrying capacity at the specified inflation pressure.

Maximum loaded vehicle mass is the sum of the following:

- a) curb mass;
- b) accessory mass;
- c) vehicle capacity mass;
- d) production option mass.

Curb mass is the mass of a motor vehicle with standard equipment. including the maximum capacity of fuel. oil. and coolant. and. if so equipped. of air conditioning and the additional mass of an optional engine.

Accessory mass is the combined mass (in excess of those standard items that can be replaced) of automatic transmission. power steering. power brakes. power windows. power seats. radio. and heater. to the extent that these items are available as factory-installed equipment (whether installed or not).

Normal occupant mass is equivalent to 68 kg multiplied by the number of occupants. as specified in Table 7. When local regulation includes a luggage mass. a mass of 7 kg per occupant. located in the luggage compartment. shall be used. Occupant distribution is the distribution of occupants in a vehicle as specified in Table 7.

Table 7 — Occupant loading and distribution for vehicle normal load for various designated seating capacities

| Designated seating capacity. number of occupants | Vehicle normal load. number of occupants | Occupant distribution in a normally loaded vehicle |
|---|---|---|
| 2 to 4 | 2 | 2 in front |
| 5 and above | 3 | 2 in front. 1 in second seat |

Vehicle capacity mass is the rated cargo and luggage load plus 68 kg multiplied by the vehicle designated seating capacity.

Production option mass is the combined mass of those installed regular production options. weighing over 2.3 kg in excess of those standard items they replace. not previously considered in curb mass or accessory mass. and including heavy duty brakes. ride levellers. roof rack. heavy duty battery. and special trim.

10 CAMBER ANGLE

Vehicle camber angles. especially under severe driving conditions. have an influence on tyre performance. For low aspect ratio tyres. increasing the camber angle above 2° makes constraints on the tyre performance. e.g. mileage. uneven wear. and other criteria. Consult the tyre manufacturer for more information.

Generally. it is recommended that the camber angles of vehicles should not be greater than 4° including any tolerance.

On vehicles with speeds in excess of 270 km/h. it is recommended that the camber angle should not be greater than 3° including any tolerance.

Vehicle camber angles on a passenger car should not exceed the values for different aspect ratios in [Table 8](#).

Table 8 — Maximum camber angle for different aspect ratios

| Aspect ratio H/S | Maximum camber angle | |
|---------------------|----------------------|----------------|
| | up to 270 km/h | above 270 km/h |
| 80 to 25 | 4° | 3° |
| 20 | 3° | 3° |

The only way to compensate for camber angle is by increasing the inflation pressure by multiplying it with the camber factor as shown in [Table 9](#). This shall be applied to tyres for all speeds.

The maximum inflation pressure of 350 kPa shall be observed. For a given size. if the calculated pressure exceeds the maximum. then this size is not suitable for this application.

For static camber angle. γ . between 2° and 4°. the camber factor. K_S . is calculated as follows:

- for aspect ratio 50 and above. see [Formula \(11\)](#):

$$K_s = 1 / (1.1 - 0.05 \times Y)^{1.25}$$

- for aspect ratio. H/S. 45 to 25. see [Formula \(12\)](#):

$$K_s = 1 / (1 + (0.2625 - 0.00325 \times H/S) \times (1 - Y/2))^{1.25}$$

— for aspect ratio 20. see [Formula \(13\)](#):

$$K_s = 1 / (1 + 0.3 \times (1 - Y/2))^{1.25}$$

See [Table 9](#).

Table 9 — Compensation of camber angle by camber factor

| Camber γ | Camber factor K_s | | | | | | |
|--------------------|------------------------|------------|------------|------------|------------|------------|------------|
| | $H/S \geq 50$ | $H/S = 45$ | $H/S = 40$ | $H/S = 35$ | $H/S = 30$ | $H/S = 25$ | $H/S = 20$ |
| 2° | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| $2^\circ 15'$ | 1.015 8 | 1.018 5 | 1.021 1 | 1.023 7 | 1.026 4 | 1.029 1 | 1.048 9 |
| $2^\circ 30'$ | 1.032 2 | 1.037 6 | 1.043 0 | 1.048 5 | 1.054 1 | 1.059 7 | 1.102 4 |
| $2^\circ 45'$ | 1.048 9 | 1.057 3 | 1.065 8 | 1.074 4 | 1.083 1 | 1.092 0 | 1.160 9 |
| 3° | 1.066 2 | 1.077 7 | 1.089 5 | 1.101 4 | 1.113 6 | 1.126 1 | 1.225 3 |
| $3^\circ 15'$ | 1.084 0 | 1.098 9 | 1.114 1 | 1.129 7 | 1.145 7 | 1.162 2 | |
| $3^\circ 30'$ | 1.102 4 | 1.120 8 | 1.139 8 | 1.159 4 | 1.179 5 | 1.200 4 | |
| $3^\circ 45'$ | 1.121 3 | 1.143 5 | 1.166 5 | 1.190 4 | 1.215 2 | 1.240 9 | |
| 4° | 1.140 8 | 1.167 0 | 1.194 4 | 1.223 0 | 1.252 8 | 1.284 0 | |

11 MARKING

Each tyre shall be marked legibly and indelibly at least on one side wall with the following details:

The marking shall include designations of the following:

- a) size and construction;
- b) service description (see [4.2.1](#));
- c) any other service characteristics.

The location of the marking of the load index and speed category shall be distinct, but near the marking of the size and construction.

No location is specified for the markings related to other service characteristics (see [4.3](#)).

EXAMPLE A tubeless tyre having a nominal section width of 165 mm, a nominal aspect ratio of 80, a radial construction and a nominal rim diameter code of 15, whose service description consists of a load index of 87 corresponding to a tyre load-carrying capacity of 545 kg, and which falls into the speed symbol H (210 km/h), is marked:

165/80 R 15 87 H TUBELESS

NOTE See Appendix D for other existing size markings.

- d) Trade mark;
- e) Manufacturer's code;

- f) Month and year of manufacture or week and year of manufacture; and
- g) Direction of rotation (on directional type tyres)

12 METHODS OF TEST

Tests shall be carried out as prescribed in Appendix F of this standard and **ISO 10191**.

APPENDIX A

(informative)

Guideline values for metric-series tyres

Guidelines for design dimensions for metric-series tyres mounted on 5° rims (code-designated), with a nominal rim diameter expressed by a two-figure code, are given in [Tables A.1](#) to [A.9](#) as a function of the nominal aspect ratio.

These tables are provided for convenience. The values shown are calculated from the formulae given in [Clause 6](#). The formulae always prevail in the case of a contradiction.

Table A.1 — Nominal aspect ratio (H/S) of 95 to 75 ($K_1 = 0.7$; $K_2 = 0.7$)

| Nominal section width S_N mm | Measuring rim width code R_{mc} | Design tyre dimensions mm | | | | | | Approved rim width codes | |
|-----------------------------------|--------------------------------------|---------------------------|---------------------------------------|-----|-----|-----|-----|--------------------------|------|
| | | Section width S | Section height H at H/S (%) of | | | | | | |
| | | | 95 | 90 | 85 | 80 | 75 | min. | max. |
| 95 | 2.5 | 94 | 90 | 86 | 81 | 76 | 71 | 2.5 | 3.0 |
| 105 | 3.0 | 106 | 100 | 95 | 89 | 84 | 79 | 2.5 | 3.5 |
| 115 | 3.0 | 113 | 109 | 104 | 98 | 92 | 86 | 3.0 | 4.0 |
| 125 | 3.5 | 126 | 119 | 113 | 106 | 100 | 94 | 3.0 | 4.0 |
| 135 | 3.5 | 133 | 128 | 122 | 115 | 108 | 101 | 3.5 | 4.5 |
| 145 | 4.0 | 145 | 138 | 131 | 123 | 116 | 109 | 3.5 | 5.0 |

NOTE Rims outside the approved range in use from previous designs are not approved for new designs.

APPENDIX B

(normative)

Load indices for passenger car tyres

[Table B.1](#) gives tyre load indices, grouped by nominal rim diameter and nominal aspect ratio, based on a reference pressure of 250 kPa for the standard load version, and 290 kPa for the reinforced or extra load version.

[Table B.2](#) gives the load indices for T-type temporary-use spare tyres, for light load and standard load (SL) version, with a reference pressure of 420 kPa.

[Table B.3](#) gives the load indices for P-type light load tyres with a reference pressure of 250 kPa.

Table B.1 — Load indices for standard load version with a reference pressure of 250 kPa and for reinforced or extra load version with a reference pressure of 290 kPa

| Nominal section width | Nominal rim diameter code | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

^a SL: standard load version; based on a reference pressure of 250 kPa.

^b XL: reinforced or extra load version; based on a reference pressure of 290 kPa.

^c Not internationally harmonized. See published local standards.

Table B.2 — Load indices for T-type temporary-use spare tyres, for light load and standard load version, with a reference pressure of 420 kPa

a Not internationally harmonized. See published local standards.

APPENDIX C (normative)

Minimum inflation pressure for intermediate load

Table C.1 applies to tyre sizes given in Table B.1; the reference pressure is 250 kPa.

Table C.1 — Tyre load-carrying capacity at various inflation pressures for standard load (kg)

| Tyre load index. LI | Tyre inflation pressure kPa | | | | | | | |
|------------------------|--------------------------------|-----|-----|-----|-----|-----|-----|-----|
| | 180 | 190 | 200 | 210 | 220 | 230 | 240 | 250 |

| 111 | 1 015 | 1 040 | 1 065 | 1 090 |
| 112 | 1 045 | 1 070 | 1 095 | 1 120 |
| 113 | 1 070 | 1 100 | 1 125 | 1 150 |
| 114 | 1 100 | 1 125 | 1 155 | 1 180 |
| 115 | 1 130 | 1 160 | 1 190 | 1 215 |
| 116 | 1 165 | 1 195 | 1 220 | 1 250 |
| NOTE This table only applies to speeds up to 160 km/h. For speeds over 160 km/h. refer to Table C.4 or consult the tyre manufacturer. | | | | |
| a To be used if load index for standard load is 100. | | | | |
| b To be used if load index for standard load is 101. | | | | |

For inflation pressures 250 kPa and below. use standard load values for specific tyre size. e.g. for 195/50 R17 tyre. standard load = 85 LI and extra load = 89.

For intermediate loads for the extra load version of this tyre. at inflation pressures 260 kPa through 290 kPa. use values in [Table C.2](#) for LI 89.

For loads at pressures 250 kPa and below. use standard load 85 LI values in [Table C.1](#).[Table C.3](#)

applies to tyre sizes given in [Table B.3](#); the reference pressure is 250 kPa.

Table C.3 — Tyre load-carrying capacity at various inflation pressures for light load (kg)

| Tyre load index. LI | Tyre inflation pressure kPa | | | | | | | |
|------------------------|--------------------------------|-----|-----|-----|-----|-----|-----|-----|

| 115 | 980 | 1 015 | 1 050 | 1 085 | 1 120 | 1 150 | 1 185 | 1 215 |
| 116 | 1 010 | 1 045 | 1 080 | 1 115 | 1 150 | 1 185 | 1 215 | 1 250 |

NOTE This table only applies to speeds up to 160 km/h. For speeds over 160 km/h. refer to Table C.4 or consult the tyre manufacturer.

[Table C.4](#) applies to speeds over 160 km/h.

Table C.4 — Inflation pressure adjustment for vehicle speed for tyre load-carrying capacity for speeds over 160 km/h

| Vehicle operating speed km/h | Speed symbol | | | | | | |
|------------------------------|--------------|---------|---------|---------|---------|---------|---------|
| | S | T | U | H | V | W | Y |
| 170 | +10 kPa | +10 kPa | +10 kPa | +10 kPa | +10 kPa | — | — |
| 180 | +10 kPa | +10 kPa | +10 kPa | +10 kPa | +10 kPa | — | — |
| 190 | — | +20 kPa | +20 kPa | +20 kPa | +20 kPa | — | — |
| 200 | — | — | +20 kPa | +20 kPa | +20 kPa | +10 kPa | — |
| 210 | — | — | — | +30 kPa | +30 kPa | +20 kPa | — |
| 220 | — | — | — | — | +30 kPa | +30 kPa | — |
| 230 | — | — | — | — | +30 kPa | +40 kPa | +10 kPa |
| 240 | — | — | — | — | +30 kPa | +50 kPa | +20 kPa |
| 250 | — | — | — | — | — | +50 kPa | +30 kPa |
| 260 | — | — | — | — | — | +50 kPa | +40 kPa |
| 270 | — | — | — | — | — | +50 kPa | +50 kPa |
| 280 | — | — | — | — | — | — | +50 kPa |
| 290 | — | — | — | — | — | — | +50 kPa |
| 300 | — | — | — | — | — | — | +50 kPa |

NOTE 1 Adjustment is made to the pressure required for the application load.

NOTE 2 The calculated inflation pressure is based on the load and speed, and it is not less than the following:

- for speeds of 160 km/h or less, inflation pressure is ≥ 140 kPa;
- for speeds greater than 160 km/h, inflation pressure is ≥ 180 kPa.

EXAMPLE 1 The following is an example of calculation of minimum required inflation pressure for heavily loaded condition.

- Tyre: 325/40R17 109Y.
- Vehicle speed capability: 270 km/h.
- Maximum vehicle load on tyre: 1 030 kg (100 % of load index).
- Required inflation pressure based on load equals to 250 kPa.
- Increase in inflation pressure based on speed equals to +50 kPa (see adjustment in [Table C.4](#) for Y-rated tyre at 270 km/h).
- Calculated inflation pressure based on load and speed: $250 + 50 = 300$ kPa.
- Minimum inflation pressure for speed: $270 \text{ km/h} = 180$ kPa.
- Minimum required inflation pressure: 300 kPa.

In the heavily loaded condition, the inflation pressure based on load and speed adjustment is selected.

EXAMPLE 2 The following is an example of calculation of minimum required inflation pressure for lightly loaded condition.

- Tyre: 325/40R17 109Y.
- Vehicle speed capability: 270 km/h.
- Maximum vehicle load on tyre: 618 kg (60 % of load index).
- Required inflation pressure based on load = 114 kPa using the following method:

(Actual load/maximum load based on load index) $1.538 \times$ pressure corresponding to the maximum load of the tyre (LI)

NOTE 1.538 is the reciprocal of the ISO pressure coefficient

of $0.65 \cdot (618\text{kg} / 1030\text{kg})$ $1.538 \times 250 = 114 \text{ kPa}$

- Increase in inflation pressure based on speed = +50 kPa (see adjustment in [Table C.4](#) for Y-rated tyre at 270 km/h).
- Calculated inflation pressure based on load and speed: $114 + 50 = 164 \text{ kPa}$.
- Minimum inflation pressure for speed: 270 km/h = 180 kPa.
- Minimum required inflation pressure: 180 kPa.

In the lightly loaded condition, the minimum inflation value is selected.

APPENDIX D

(informative)

Other existing size markings

A series of tyres for radial construction whose identification is not in accordance with the tyre size designation defined in this document is currently marketed in various countries.

In particular, this tyre size designation does not include the nominal aspect ratio. These radial tyres were in existence long before publication of the first edition of this document, and traditionally they pertain to the metric series. Although sometimes quoted as 82 series tyres, their dimensions are similar to those of tyres identified by a nominal aspect ratio of 80.

Their size designation and relevant dimensions are shown in [Table D.1](#).

Table D.1 — Metric-series radial tyres with other markings

Dimensions in millimetres

| Designation of size and construction | Measuring rim width code | Design tyre dimensions | | tyre dimensions in service(grown) | |
|--------------------------------------|--------------------------|------------------------|------------------------|-----------------------------------|-------------------------------|
| | | Section width S | Overall diameter D_0 | Overall width W_{\max} | Overall diameter $D_{0,\max}$ |
| 125 R 12 | 3½ | 127 | 510 | 132 | 518 |
| 125 R 15 | | | 588 | | 596 |
| 135 R 12 | 4 | 137 | 522 | 142 | 531 |
| 135 R 13 | | | 548 | | 557 |
| 135 R 14 | | | 574 | | 583 |

APPENDIX E CRITERIA FOR CONFORMITY

COMPLIANCE OF A LOT

The sampling scheme given in Appendix E should be applied where compliance of a lot to the requirements of this Specification is to be assessed based on statistical sampling and inspection.

Where compliance with this Specification is to be assured, appropriate schemes of sampling and inspection shall be adopted based on manufacturer's control systems coupled with type tests and testing procedures.

E.1 LOT

E.1.1 In any consignment, all tyres of the same size belonging to one batch of a manufacture or supply shall constitute a lot.

E.2 SCALE OF SAMPLING

E.2.1 The samples shall be inspected and tested from each lot for ascertaining conformity of the lot to the requirements of this Specification.

E.2.2 The number of tyres to be selected as the sample from a lot shall be in accordance with Table E.1.

Table E.1 – Scale of sampling

| No. of tyres in the lot (1) | No. of tyres to be selected for the sample (2) |
|--|---|
| Up to 1 200 | 5 |
| 1 201 to 35 000 | 8 |
| 35 001 and above | 13 |

E.2.3 All tyres shall be selected at random. In order to ensure randomness of selection, random number tables as given in **SLS 428** shall be used.

E.3 NUMBER OF TESTS

E.3.1 Each tyre selected as in **E.2.2** shall be inspected for marking requirements specified in Clause 11.

E.3.2 Each tyre selected as in **E.2.2** shall be tested for dimension and tread wear indicator requirements specified in Clauses 5 and 6.5.

E.3.3 Each tyre selected as in **E.2.2** shall be tested for inflation pressures and load carrying-capacities indicator requirements specified in Clauses 7 and 8.

E.3.4 If the sample satisfies the above inspection/ tests given as in **E.3.1**, **E.3.2** and **E.3.3**. then following tests shall be performed on four (04) units in the sample in accordance with Table **E.2**.

Table E.2 – Tyres for performance requirements

| No. of tyres (1) | Requirement (2) |
|----------------------------|--|
| 1 | Endurance test (Clause 6.1) |
| 1 | Strength test (Clause 6.2) |
| 1 | High speed performance test (Clause 6.3) |
| 1 | Bead Unseat test (Clause 6.4) |

E.4 CRITERIA FOR CONFORMITY

A lot shall be declared as conforming to the requirements of this standard if the following conditions are satisfied.

E.4.1 Each tyre inspected as in **E.3.1** and **E.3.2** shall satisfies the relevant requirements.

E.4.2 Each tyre tested as in **E.3.3** shall satisfies the relevant requirements.

E.4.3 Tyres tested as in **E.3.4** shall satisfies the relevant requirements.

APPENDIX F **MEASUREMENT OF DIMENSIONS**

F.1 Before being measured. the tyre shall be mounted on its measuring rim. inflated to the recommended pressure given in Table **4** and allowed to stand for a minimum of 24 h at room temperature after which the inflation pressure shall be readjusted to the original value.

F.2 Calliper the section width and the overall width of the tyre at six points approximately equally spaced around the tyre circumference. Record the average of these measurements as section width and overall width. respectively.

F.3 Determine the overall tyre diameter by measuring maximum circumference of the tyre and dividing this dimension by π (where $\pi = 3.1416$).
